1. The function

 $\beta(\mathbf{x}, \mathbf{y}) = \mathbf{x}^T \begin{bmatrix} 2 & -1 \\ -1 & 1 \end{bmatrix} \mathbf{y}$

is

not bilinear

⊘ Correct

- not positive definite
- an inner product
- not an inner product
- **✓** symmetric
- **⊘** Correct
- Yes: $\beta(\mathbf{x}, \mathbf{y}) = \beta(\mathbf{y}, \mathbf{x})$
- positive definite

Correct

Yes, the matrix has only positive eigenvalues and $eta(\mathbf{x},\mathbf{x})>0$ for all $\mathbf{x}
eq \mathbf{0}$ and $\beta(\mathbf{x}, \mathbf{x}) = 0 \iff \mathbf{x} = \mathbf{0}$

It's symmetric, bilinear and positive definite. Therefore, it is a valid inner product.

✓ bilinear

⊘ Correct

Yes:

- eta is symmetric. Therefore, we only need to show linearity in one argument.
- For any $\lambda \in \mathbb{R}$ it holds that $\beta(\mathbf{x} + \lambda \mathbf{z}, \mathbf{y}) = \beta(\mathbf{x}, \mathbf{y}) + \lambda \beta(\mathbf{z}, \mathbf{y})$. This holds because of the rules for vector-matrix multiplication and addition.
- not symmetric
- 2. The function

 $eta(\mathbf{x}, \mathbf{y}) = \mathbf{x}^T \begin{bmatrix} 1 & -1 \\ -1 & 1 \end{bmatrix} \mathbf{y}$

not bilinear

Correct

not an inner product

Correct: Since β is not positive definite, it cannot be an inner product. positive definite

Correct

✓ bilinear

Correct:

- $oldsymbol{eta}$ is symmetric. Therefore, we only need to show linearity in one argument. • $\beta(\mathbf{x} + \lambda \mathbf{z}, \mathbf{y}) = \beta(\mathbf{x}, \mathbf{y}) + \lambda \beta(\mathbf{z}, \mathbf{y})$. This holds because of the rules for vector-matrix
- multiplication and addition.
- not symmetric
- not positive definite
- **⊘** Correct
- With $x=[1,1]^T$ we get $\beta(\mathbf{x},\mathbf{x})=0$. Therefore β is not positive definite.
- ✓ symmetric

Correct Correct: $\beta(\mathbf{x}, \mathbf{y}) = \beta(\mathbf{y}, \mathbf{x})$

an inner product

3. The function

 $eta(\mathbf{x},\mathbf{y}) = \mathbf{x}^T \begin{bmatrix} 2 & 1 \\ -1 & 1 \end{bmatrix} \mathbf{y}$

is

symmetric

✓ not symmetric **⊘** Correct

Correct: If we take $\mathbf{x}=[1,1]^T$ and $\mathbf{y}=[2,-1]^T$ then $\beta(\mathbf{x},\mathbf{y})=0$ but $\beta(\mathbf{y},\mathbf{x})=6$. Therefore, β is not symmetric.

- ✓ bilinear **⊘** Correct
- Correct. not bilinear
- an inner product
- not an inner product **⊘** Correct
- Correct: Symmetry is violated.

4. The function

 $\beta(\mathbf{x}, \mathbf{y}) = \mathbf{x}^T \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \mathbf{y}$ is

an inner product

not bilinear

Correct

It is the dot product, which we know already. Therefore, it is also an inner product.

positive definite

Correct

It is the dot product, which we know already. Therefore, it is positive definite. not an inner product

- not symmetric
- not positive definite
- ✓ bilinear **⊘** Correct
- It is the dot product, which we know already. Therefore, it is positive bilinear.
- ✓ symmetric

Correct It is the dot product, which we know already. Therefore, it is symmetric.

import numpy as np

5. For any two vectors $\mathbf{x},\mathbf{y}\in\mathbb{R}^2$ write a short piece of code that defines a valid inner product.

def dot(a, b): 3 """Compute dot product between a and b. a, b: (2,) ndarray as R^2 vectors Returns: a number which is the dot product between a, b 9 10 11 dot_product = np.dot(a, b) 12 13 return dot_product 14 15 # Test your code before you submit. 16 a = np.array([1,1]) 17 b = np.array([2,4]) Run 18 print(dot(a,b)) 19 Reset

Correct Good job!
